## PAPER : COSTING

Answer to questions are to be given only in English except in the case of candidates who have opted for Hindi Medium. If a candidate who has not opted for Hindi Medium. His/her answer in Hindi will not be valued.

Question No. 1 is compulsory.
Candidates are also required to answer any Four questions from the remaining Five Questions.
In case, any candidate answers extra question(s)/sub-question(s) over and above the required number, then only the requisite number of questions first answered in the answer book shall be valued and subsequent extra question(s) answered shall be ignored.
Wherever necessary, suitable assumptions may be made and disclosed by way of note.

## Answer 1:

(a) Working Notes:

Computation of Annual consumption \& Annual Demand for raw material 'Dee':
$\left.\begin{array}{|l|r|}\hline \text { Sales forecast of the product 'Exe' } & 10,000 \text { units } \\ \hline \text { Less: Opening stock of 'Exe' } & 900 \text { units } \\ \hline \text { Fresh units of 'Exe' to be produced } & 9,100 \mathrm{units} \\ \hline \text { Raw material required to produce } 9,100 \text { units of 'Exe' }(9,100 \text { units } \times 2 \mathrm{~kg} .) & 18,200 \mathrm{~kg} . \\ \hline \text { Less: Opening Stock of 'Dee' } & 1, \mathbf{1 / 2} \mathbf{~ M}\} \\ \hline \text { Annual demand for raw material 'Dee' } & 17,200 \mathrm{~kg} . \\ \hline\end{array}\right\} \mathbf{1 / 2 ~ M \}}$
(i) Computation of Economic Order Quantity (EOQ):

$$
\begin{aligned}
\text { EOQ } & =\sqrt{\frac{2 \times \text { Annual demand of 'Dee' x Ordering } \operatorname{cost}}{\text { Carrying } \cos \text { t per unit per annum }}} \\
& \left.=\sqrt{\frac{2 \times 17,200 \mathrm{~kg} . \times \text { Rs. } 720}{\text { Rs. } 125 \times 13.76 \%}}=\sqrt{\frac{2 \times 17,200 \mathrm{~kg} . \times \text { Rs. } 720}{\text { Rs. } 17.2}}=1,200 \mathrm{~kg} .31 / 2 \mathrm{M}\right\}
\end{aligned}
$$

(ii) Re- Order level:
= (Maximum consumption per day x Maximum lead time)
$=\left\{\left(\frac{\text { Annual consumption of 'Dee' }}{364 \text { days }}+20 \mathrm{~kg}.\right) x 8\right.$ days $\}$
$=\left\{\left(\frac{18,200 \text { kg.' }}{364 \text { days }}+20 \mathbf{k g}.\right) \boldsymbol{x} 8\right.$ days $\}=560$ kg. $\left.\} 1 / 2 \mathbf{~ M}\right\}$
(iii) Minimum consumption per day of raw material 'Dee':

Average Consumption per day $\quad=50 \mathrm{Kg}$.
Hence, Maximum Consumption per day $=50 \mathrm{~kg} .+20 \mathrm{~kg} .=70 \mathrm{~kg}$.
So Minimum consumption per day will be
$\begin{array}{ll}\text { Average Consumption } & =\frac{\text { Min. consumption }+ \text { Max. consumption }}{2} \\ O r, 50 \mathrm{~kg} . & =\frac{\text { Min. consum ption }+70 \mathrm{~kg} .}{2}\end{array}$

Or, Min. consumption
$=100 \mathrm{~kg}-70 \mathrm{~kg}$.
$=30 \mathrm{~kg}$.
(a) Re-order Quantity : EOQ $-200 \mathrm{~kg} . \quad=1,200 \mathrm{~kg} .-200 \mathrm{~kg} . \quad=1,000 \mathrm{~kg} .\{1 / 2 \mathrm{M}\}$
(b) Maximum Stock level:
$=$ Re-order level + Re-order Quantity - (Min. consumption per day $\times$ Min. lead time)
$=560 \mathrm{~kg} .+1,000 \mathrm{~kg} .-(30 \mathrm{~kg} \times 4$ days $)$
$1,560 \mathrm{~kg} .-120 \mathrm{~kg} .=1,440 \mathrm{~kg} .\{1 / 2 \mathrm{M}\}$
(c) Minimum Stock level:
$=$ Re-order level - (Average consumption per day $\times$ Average lead time)

$$
=560 \mathrm{~kg} .-(50 \mathrm{~kg} . \times 6 \text { days })=260 \mathrm{~kg} .\{1 / 2 \mathrm{M}\}
$$

(d) Impact on the profitability of the company by not ordering the EOQ.

|  |  |  | When purchasing the ROQ | When purchasing the EOQ |
| :---: | :---: | :---: | :---: | :---: |
|  | I | Order quantity | 1,000 kg. | 1,200 kg. |
|  | II | No. of orders a year | $\frac{17,200 \mathrm{~kg} .}{1,000 \mathrm{~kg} .}=17.2 \text { or } 18 \text { orders }$ | $\frac{17,200 \mathrm{~kg} .}{1,200 \mathrm{~kg} .}=14.33 \text { or } 15 \text { orders }$ |
| \{1/4 M Each \} | III | Ordering Cost | 18 orders $\times$ Rs. $720=$ Rs.12,960 | 15 orders $\times$ Rs. $720=$ Rs. 10,800 |
|  | IV | Average Inventory | $\frac{1,000 \mathrm{~kg} .}{2}=500 \mathrm{~kg} .$ | $\frac{1,200 \mathrm{~kg} .}{2}=600 \mathrm{~kg} .$ |
| \{1/4 M Each $\}$ | V | Carrying Cost | $500 \mathrm{~kg} . \times$ Rs. 17.2 = Rs. 8,600 | $600 \mathrm{~kg} . \times$ Rs. $17.2=$ Rs. 10,320 |
|  | VI | Total Cost | Rs. 21,560 | Rs. 21,120 |

Extra Cost incurred due to not ordering EOQ = Rs. 21,560 - Rs. $21,120=$ Rs. 440 \}1/2 M\}

## Answer:

(b)

Budgeted Production 30,000 hours $\div 6$ hours per unit $=5,000$ units $\{1 / 2 \mathrm{M}\}$ Budgeted Fixed Overhead Rate $=$ Rs. $45,00,000 \div 5,000$ units $=$ Rs. 900 per unit Or $=$ Rs. $45,00,000 \div 30,000$ hours $=$ Rs. 150 per hour. $\{1 / \mathbf{2} \mathbf{~ M}\}$
(i) Material Cost Variance $=($ Std. Qty. $\times$ Std. Price $)-($ Actual Qty. $\times$ Actual Price $)$

## Answer:

(c)
(1) Break-even sales $=\frac{\text { FixedCost }}{\text { P/VRatio }}$

$$
\begin{aligned}
& \text { PN Ratio }=\frac{\text { ChangeinProfit }}{\text { ChangeinSales }} \times 100 \text { or, } \frac{\text { Rs. } 37,50,000}{\text { Rs. } 7,80,60,000-\text { Rs. } 5,93,10,000} \times 100 \\
& \text { Or, } \frac{\text { Rs. } 37,50,000}{\text { Rs. } 1,87,50,000} \times 100 \text { or, } 20 \%
\end{aligned}
$$

$$
\text { Break-even sales } \quad=\frac{\text { Rs. } 98,50,000}{20 \%}=\text { Rs. } 4,92,50,000 \quad\left\{1^{1 / 2} \mathbf{M}\right\}
$$

(ii) Profit loss $=$ Contribution - Fixed Cost
$=$ Rs. $8,20,00,000 \times 20 \%$ - Rs. $98,50,000$

$$
\begin{aligned}
& \text { Rs. } \left.1,64,00,000-\text { Rs. } 98,50,000=\text { Rs. } 65,50,000\}^{1 / 2} \mathrm{M}\right\}
\end{aligned}
$$

(iii) To earn same amount of profit in $20 \times 8$-X9 as was in 20X7-X8, it has toearn the same amount of contribution as in 20X7-X8.
Sales - Variable cost $=$ Contribution equal to 20X7-X8 contribution
Contribution in 20X7-X8 = Sales in 20X7-X8 $\times$ PN Ratio in 20X7-X8

$$
=\text { Rs. } 5,93,10,000 \times 20 \%=\text { Rs. } 1,18,62,000
$$

Let the number of units to be sold in $20 \mathrm{X} 8-\mathrm{X} 9=\mathrm{X}$
Sales in 20X8-X9 - Variable cost in 20X8-X9 = Desired Contribution
$90 \mathrm{X}-80 \mathrm{X}=$ Rs. 1,18,62,000
Or, $10 \mathrm{X}=1,18,62,000$
Or, $X=11,86,200$ units
Therefore, Sales amount required to earn a profit equals to 20X7-X8 profit
$=$ Rs. $90 \times 11,86,200$ units $=$ Rs. $10,67,58,000 \quad\{\mathbf{~ M}\}$

## Answer:

(d)
(1) Contribution per unit $=$ Selling price per unit - Variable cost per unit

$$
\begin{aligned}
& =\text { Rs. } 50-\{\text { Rs. }(16,00,000+4,00,000+8,00,000) \div 80,000 \text { units }\} \\
& =\text { Rs. } 50-\text { Rs. } 35=\text { Rs. } 15
\end{aligned}
$$

(2) Profit - Volume (P/V) Ratio $=\frac{\text { Contribution per unit }}{\text { Selling price per unit }} \times \frac{100}{\text { Rs. } 50}=15 \times 100=30 \%$

## Calculations:

(i) The number of units to be sold for neither loss nor gain i.e. Break-even units:

$$
\left.\left.=\frac{\text { Fixed }}{\text { Overheads Contribution per unit }}=\frac{\text { Rs. } 7,20,000}{\text { Rs. } 15}=48,000 \text { units }\right\} 1 \mathrm{M}\right\}
$$

(ii) The sales needed to earn a profit of $\mathbf{2 0 \%}$ on sales:

As we know
$S=V+F+P$
(S = Sales; V = Variable Cost; F = Fixed Cost; P = Profit)
Suppose Sales units are $x$ then
Rs. 50 x
$=$ Rs. $35 x+$ Rs. $7,20,000+$ Rs. $10 x$
Rs. $50 x$-Rs. $45 x=$ Rs. $7,20,000$
Or, $\mathrm{x}=\frac{\boldsymbol{R s} .7,20,000}{\boldsymbol{R s} .5}$

$$
=1,44,000 \text { units }\} 1 \mathrm{~m}\}
$$

Therefore, Sales needed $=1,44,000$ units $\times$ Rs. $50=$ Rs. $72,00,000$ to earn a profit of $20 \%$ on sales.
(iii) Calculation of extra units to be sold to earn present profit of Rs. 4,80,000 under the following proposed selling price:

(iv) Sales price to bring down BEP to $\mathbf{1 0 , 0 0 0}$ units:

BEP (Units) $\quad=\quad \frac{\text { Fixed } \cos t}{\text { Contribution per unit }}$
Or Contribution per unit $=\quad \frac{\text { Rs. } 7,20,000}{10,000 \text { units }}=$ Rs. 72
So, Sales Price (per unit)

$=$ Vanable Cost + Contribution

$=$ Rs. $35+$ Rs. $72=$ Rs. 107$\}\{\mathbf{~ M}\}$

| $\begin{aligned} & *(18,75,000+2,75,000-3,10,000-(1,47,000 \times 10 \%)+1,90,000-1,70,800-(2,57,250 \times \\ & -2,57,250+2,08,000-2,45,600)=12,22,650 \end{aligned}$ | 100/175\%) - 1,80,000 |

## Working notes

Purchase of raw materials $=$ Raw material consumed + Closing stock - opening stock of raw material
Raw material consumed = Prime cost - Direct wages - Direct expenses
Factory Overheads $=2,57,250 * 100 / 175$
Prime cost = Factory cost + Closing WIP - Opening WIP - Factory overheads
Factory Cost = Cost of Production goods sold + Closing stock of Finished goods - Opening stock of finished
goods - Administrative overheads
Net Profit = Sales - Cost of sales

## Working notes

Purchase of raw materials = Raw material consumed + Closing stock - opening stock of raw material
Raw material consumed $=$ Prime cost - Direct wages - Direct expenses
Factory Overheads $=257250 * 100 / 175$
Prime cost = Factory cost + Closing WIP - Opening WIP - Factory overheads
Factory Cost = Cost of Production goods sold + Closing stock of Finished goods - Opening stock of finished goods
Net Profit = Sales - Cost of sales

## Answer 6:

## (a) Difference between Cost Control and CostReduction

| Cost Control | Cost Reduction |
| :--- | :--- | :--- |
| 1. Cost control aims at maintaining <br> the costs in accordance with the <br> established standards. | 1.Cost reduction is concerned with reducing <br> costs. It challenges all standards and <br> endeavours to better them continuously |
| 2.Cost control seeks to attain <br> lowest possible cost under <br> existing conditions. | 2.Cost reduction recognises no condition <br> as permanent, since a change will result in <br> lower cost. |
| 3. In case of cost control, |  |
| emphasis is on past and present | 3. In case of cost reduction, it is on present |
| and future. |  |

## Answer:

(b) Accounting treatment of idle time wages \& overtime wages in cost accounts: Normal idle time is treated as a part of the cost of production. Thus, in the case of direct workers, an allowance for normal idle time is built into the labour cost rates. In the case of indirect workers, normal idle time is spread over all the products or jobs through the process of absorption of factory overheads.
Under Cost Accounting, the overtime premium is treated as follows:
$>$ If overtime is resorted to at the desire of the customer, then the overtime premium may be charged to the job directly.
> If overtime is required to cope with general production program or for meeting urgent orders, the overtime premium should be treated as overhead cost of particular department or cost center which works overtime.
> Overtime worked on account of abnormal conditions should be charged to costing Profit \& Loss Account.
> If overtime is worked in a department due to the fault of another department the overtime premium should be charged to the latter department.

## Answer:

(c) Cost classification based on variability
(a) Fixed Costs - These are the costs which are incurred for a period, and which, within certain output and turnover limits, tend to be unaffected by fluctuations in the levels of activity (output or turnover). They do not tend to increase or decrease with the changes in output. For example, rent, insurance of factory building etc., remain the same for different levels of production.
(b) Variable Costs - These costs tend to vary with the volume of activity. Any increase in the activity results in an increase in the variable cost and vice-versa. For example, cost of direct labour, etc.
(c) Semi-variable Costs - These costs contain both fixed and variable components and are thus partly affected by fluctuations in the level of activity. Examples of semi variable costs are telephone bills, gas and electricity etc.
Cost classification based on controllability
(a) Controllable Costs - Cost that can be controlled, typically by a cost, profit or investment centre manager is called controllable cost. Controllable costs incurred in a particular responsibility centre can be influenced by the action of the executive heading that responsibility centre. For example, direct costs comprising direct labour, direct material, direct expenses and some of the overheads are generally controllable by the shop level management.
(b) Uncontrollable Costs - Costs which cannot be influenced by the action of a specified member of an undertaking are known as uncontrollable costs. For example, expenditure incurred by, say, the tool room is controllable by the foreman in-charge of that section but the share of the tool-room expenditure which is apportioned to a machine shop is not to be controlled by the machine shop foreman.)

## Answer:

(d) (i) Conversion cost: It is the cost incurred to convert raw materials into finished goods. It is the sum of direct wages, direct expenses and manufacturing $\boldsymbol{1}^{\mathbf{1 M}}$ overheads.
(ii) Sunk cost: Historical costs or the costs incurred in the past are known as sunk cost. They play no role in the current decision making process and are termed as irrelevant costs. For example, in the case of a decision relating to the
replacement of a machine, the written down value of the existing machine is a\} sunk cost, and therefore, not considered.
(iii) Opportunity cost: It refers to the value of sacrifice made or benefit of opportunity foregone in accepting an alternative course of action. For example, a firm financing its expansion plan by withdrawing money from its bank deposits. In such a case the loss of interest on the bank deposit is the opportunity cost for carrying out the expansion plan.
